

**Attention Business/Technology Editors:**

## **Global Data Vaulting simplifies data backup and recovery with a fully managed service that protects critical data off site**

TORONTO, Nov. 24 /CNW/ - Global Data Vaulting Inc. today introduced Secure Managed Backup Service -- a fully managed, secure and reliable service that automatically backs up critical business data according to customers' recovery and business needs.

Global Data Vaulting helps clients assess their recovery needs and then tailors a backup strategy to meet those needs. Once this process has been completed Global Data Vaulting manages the entire setup process. Appropriate communication is established, a secure Virtual Private Network (VPN) is created and the client level backup software is configured. Scheduled secure backups are performed and monitored via a secure Internet connection to a tier one data facility.

"One of the great fears of modern business is the loss of computer data and client files", said Peter Bennett, president of Hearthstone Property Management. "We have had some real scares and after a few break-ins, decided to upgrade our data protection. Like most small businesses, we were used to doing frequent back-ups and taking the data home on a zip disk or a CD. This works quite well if you religiously back-up and take the backups off site. As can happen, the time you need your backups, you find you are a day or so out of date, or, worse still, your backup is defective. Our clients will be pleased to hear that we have embarked on a program of daily backups to an off site server."

"Global Data Vaulting's Secure Managed Backup Service is designed to help businesses that don't have internal resources or IT expertise to perform and monitor data backups on a regular basis," said Jeffrey Beallor, President, Global Data Vaulting Inc.. "Our Secure Managed Backup Service lets business owners and overtaxed IT departments focus on their core business while our professionals manage and monitor the daily backup routine. If an issue arises we are able to respond immediately".

One customer put Global Data Vaulting's Secure Managed Backup Service to the test just a month after subscribing to the service for the company's servers. A corrupted file prevented him from accessing critical information. "My file including the version required was back on my computer within minutes of Global Data Vaulting receiving my request," the customer said. "I am very impressed with how the service was implemented. First the Global Data Vaulting professional assessed the recovery requirements of our servers with help from our IT department and then tailored a backup plan. This included file versioning and month end backups required to meet regulatory requirements. Once a Service Level Agreement was completed a full system backup was performed onsite and within hours of establishing a secure private connection the service began."

Global Data Vaulting's managed online data protection and recovery solutions significantly enhance business continuity by enabling data to be transmitted off site to a secure tier one data centre on a scheduled basis. Because all data backups are fully managed the Global Data Vaulting system administrator can immediately identify issues that affect the backup process and respond. When data is required for

recovery be it single files or full data sets the data can often be returned in minutes, greatly improving efficiency and resiliency should a crucial recovery need to be started.

Global Data Vaulting's Managed backup service is cost-effective since backups are automatic and it eliminates the need to purchase backup hardware, software and storage media.

### Who we are

Global Data Vaulting Inc. provides businesses with valuable high quality services, products and resources to assist with risk management and business continuity issues. Our services include business continuity evaluations, backup and recovery strategies, project management assistance and other information technology services and products. The key components that we offer are Business Continuity Assessment and Secure Managed Backup Services. In addition, we provide ancillary products and services to assist companies in securing and maintaining their information technology processes in accordance with industry "best practices".
